

• Cloud computing is the model from enabling ubiquitous, convenient, on-demand network access to a shared pool of resources that can be rapidly provisioned and released with minimal mgmt effort or service provider mgmt.

• 2011, Timothy Grance and Peter Mell.

SaaS To view/ps
PaaS design, dev, p
IaaS S+P

3 Service Models

4 Deployment Models

5 Characteristic features

Duplex, GDrive
SaaS → maintenance by CSP, no install, and users

PAAS → developer use, platform, no control on inf. Azure

IAAS → system arch +

PUBLIC → gen public, subscription, NI, AWS
PRIVATE → single org Azure, IBM
HYBRID → Google, Anthos
COMMUNITY → GCC

on demand self service

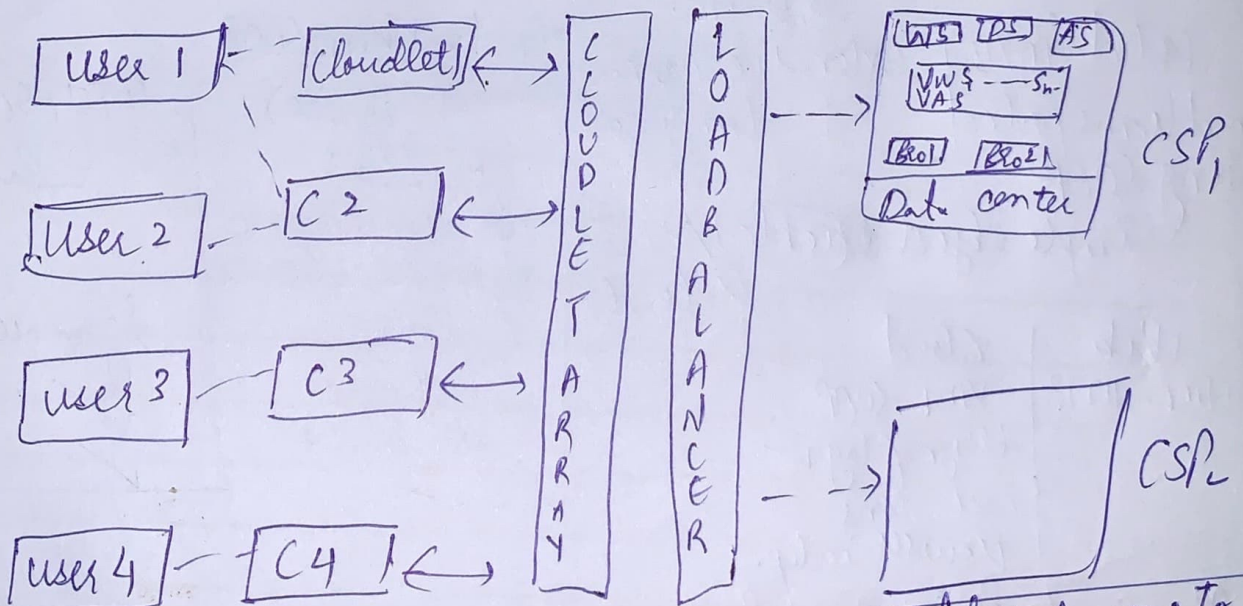

Broad access n/w → any loc

Resource pooling → multi customer from same physical

Rapid Elasticity → quick provision and release resources

Storage, Measured service → managed, tracked & controlled

mem,
n/w, bandwidth,
db.

Cloudlet

1. located at edge

intermediary cluster

of comp. b/w user & cloud

2. provides CG features close to user

3. real-time processing AR, IoT

Virtualisation logical name to Physical resource & returns a pointer

→ Hypervisor → S/W that helps to achieve V isolation, Resource Allocation

→ multi OS to share h/w.

Virtualisation Parameters
 1. Equivalence. 2. Security 3. Performance.
Types
 OS, WES, AS, DS, AS
 logical → guest entity
 host → host

HYPERVISOR
 OS
HARDWARE
cloud enabling tech.

- ① Virtualization
- ② Service oriented Arch
- ③ Grid computing.
- ④ Utility computing.

Service oriented Tech Architecture

Grid computing

comp res₁ → L₁ — common
 CR₂ → L₂ — goal
 CR₃ → L₃ —

G C vs C C

	client server	Web Services
Dist c.	scalable	services provided by one CSP to another
	flexible	CSP or CSR over web, on demand
decentral	central	elastic.

coded in XML (Extensive Markup Language)
 and transported using SOAP
 (Simple Object Access Protocol)

Web	Cloud
HTML-HTTP	XML SOAP
	design of tag ✓
	case-sens ✓
	browser indep.

SOAP → Simple Object Access Protocol.
 n/w plat used in a web service to comm data b/w 2 diff machines.
 XML → msg format
 HTTP → data trans.

REST API & Mashup

Mashup is a web application for that fetches info about configurable computing resources from the virtualized pool of CSP and provides to CSR.

- SOAP, stateless & stateful comm
- Restful API web services

REST (Representational State Transfer)

- arch style for designing n/w appli
- set of constraints used to create a light weight, scalable & maintainable web serv
- faster than SOAP

HTTP (80)	HTTPS (443)
less	Secure
creation & mainte of state at server	
static	dynamic
cookies X	✓
sessions X	✓

MICEP

Mist

IoT

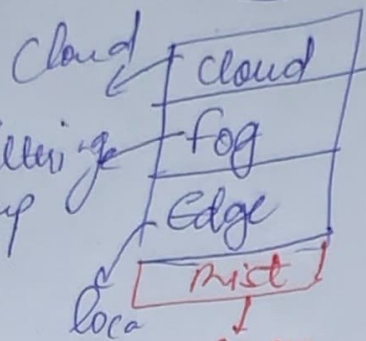

Edge → Processing data at edge of n/w

Elastic

Fluid

Fog

Edge or Mist

extends CC capability to edge of n/w

Data Center → n/w of comp

Broker → negotiate comp resources

Cloudlet → small scale data center located at edge of n/w

Non-Power Aware Data Centre → Bina power intention

Power aware DC → optimize for energy & power consumption

Actuators → action based on input

uplink : user → data center

downlink : data center → user

Panel → lightweight container used to group other components.

Frame no window allocation organizing layout within frame.

Fog + extension of cloud computing that brings storage, computing closer to the user

1. Decentralization
2. Fog nodes → devices, routers, switches

Frame → A top level container that represents a window
→ 3 Frame.

eg JPanel.
